Module Information

Our database indicates your vehicle uses a Kelsey Hayes 325 ABS controller. If your module looks different from the one pictured above, click "Change Your Module" to see all the modules we rebuild.

The Kelsey Hayes 325 module is common on GMC, Chevy, and Isuzu vehicles including the Amigo, Blazer, Bravada, Envoy, Frontera, Jimmy, Rodeo, S-10, Silverado, Suburban, and Tahoe.

The module typically fails when the ABS pump starts running continuously. Remove the ABS fuse to prevent ABS motor burn out.

Common Problems

- ABS pump motor runs continuously

What a Rebuild Includes

ModuleMaster uses a 5-step rebuild process which begins with a thorough cleaning by bead blasting. Next, our trained technicians make component-level repairs using high-grade silver solder. We then perform a preventative maintenance procedure which involves replacing all components known to fail with the highest quality upgrades available. Modules are then thermally treated to ensure longevity. While we do not have the means to test every module before shipping, we do our best to ensure trouble-free installation. If you have any problems during installation, please give us a call. We're here to help.

Unfortunately, there are some Kelsey Hayes modules that we are unable to test before shipping back to you. However, in the rare event you should have a problem with your rebuilt module, please give us a call.

Warranty

All ModuleMaster rebuilds come with a 5-year guarantee against module related failures.
